

On-Farm Extension

Connect multiple properties on one Lightwire internet connection

A Lightwire Rural Broadband *On-farm Extension* is an innovative and effective solution for when you need to extend your internet connection to other locations on your property, such as the cowshed, the office or the workshop.

In these cases, it's much more cost-effective to extend your existing connection, than it would be to install a second connection. It's also easier to manage and allows data to be shared between devices.

The connection between the locations is wireless and is facilitated by a pair of radios. These are discrete and durable, and can be managed by Lightwire remotely to access performance. The connection can be extended only where there is line of site between the locations. A Lightwire installer will confirm for you where line of site is available.

Standard installation of a Lightwire On-Farm Extension includes one WiFi-enabled router, which is located in the property that is connected directly to the Lightwire Rural Broadband site. The other locations will have a single ethernet cable to plug directly into your computer or other device.

Installation	Monthly Charges	Hardware Included
\$600 per additional location (Includes the cost of the hardware and installation)	One Lightwire Rural Broadband Plan + \$30 per additional location 12 month min. term	- A CPE (Ubiquiti PowerBeam®) - A wifi-enabled router - Cabling from the CPE - A pair of AC NanoBeams® per additional location - A drop-cable/ethernet cable per additional location
