

Solar Extension

Connect multiple properties from one solar extension site.

A Lightwire Rural Broadband *Solar Extension* provides an internet connection to your propert(ies) from anywhere on your land that has great line of sight to a Lightwire Rural Broadband tower.

A Lightwire Solar Extension site comprises solar panels, batteries to store power, a CPE to connect to the Lightwire rural broadband tower and a pair of radios that bridge the connection from the solar site to your property. A WiFi-enabled router is included in all Lightwire Rural Broadband data plans.

Lightwire Solar Extension sites are discrete, power-saving and allow flexibility to find the best location available for line of sight to one of our rural broadband towers. Once the solar extension site is installed, you own it and we'll give you a basic run down of how to operate it.

You can have multiple internet connections from one solar extension site. Where line of sight permits, the solar site can extend a connection to your home, the cowshed and the farmhand's house. In this example, each property has their own Lightwire Rural Broadband data plan and their own WiFi router.

Installation	Monthly Charges	Hardware Included
\$3000 per solar site	A Lightwire Rural Broadband plan per connection	- Solar panels, pole & battery
\$199 per additional location	+ \$10 per additional location	- A CPE (Ubiquiti PowerBeam®)
